For Photonic and RF Semiconductor Components

Driving the Semiconductor Technology Roadmap

II-VI Epiworks is a global leader and foundry for the production of high-performance III-V materials for key Photonic and RF Semiconductor Components. We develop, design and manufacture advanced compound semiconductor epitaxial wafers for use in optical components, 3D sensors, wireless devices, datacenters and high-speed communication networks. Our technology improves efficiency, expands bandwidth, and increases reliability.

Major Products

EpiDetectors®
Accelerates communication networks.

EpiSolar®
Energizes the power grid.

EpiBiFet®
Increases efficiency and performance.

Production Capability

- Materials: GaAs, InP, GaP, InAs, AlAs, GaSb, InSb, InGaAs, InGaP, AlGaAs, InGaAsP, InAlGaAs, InAlGaP
- 2-inch through 6-inch wafer production platform
- State-of-the-art materials and characterization suite
- Class 1000 cleanroom
- ISO 9001:2015 certified
InGaAs Photodetector Wafers
Raising the bar of detector technology for telecom applications.

Performance. It’s often the first thing engineers look for. But, when it comes to wafers, what’s performance without volume and consistency? You’ve got to have all three. That’s where EpiWorks comes in, supplying EpiDetector™ InGaAs photodetector wafers that combine performance with quick-lot data for better yield and quality. Grown by MOCVD, EpiWorks’ InGaAs wafers surpass industry standards, bringing next-generation technology to your application.

Taking you to the cutting edge
Moving to next-generation technology doesn’t have to be hard, and you don’t have to go it alone. EpiWorks has InGaAsP capability for advanced photodetector structures, and state-of-the-art 100 mm capability to fit your needs. Our expertise in both materials and devices results in the high-quality, high-yield products you expect and the advanced technology you need.

### Features and performance

- Typical i-layer background concentration <5e14, measured by polaron
- Quick-lot diode fab and characterization available
- Low dark current
  - Typical leakage currents less than 1nA at −5 volts
- InGaAsP capability for advanced structures

### Specifications

- 50, 75, 100 mm
- InP/InGaAs/InGaAsP
- Photodetector devices
- MOCVD production
- Telecommunications applications
**InGaP/GaAs HBT Wafers**

For high-performance power amplifier and high-speed digital applications.

Designed specifically for today's CDMA and GSM wireless devices and OC-192 networking applications, Epiworks' InGaP/GaAs heterojunction bipolar transistors (HBT) deliver the performance and reliability you demand. Manufactured on an Aixtron MOCVD production platform, EpiHBT™ wafers set a new standard for quality, performance, and yield.

InP HBT Wafers

Next-generation materials and technology for high-speed, low-power applications.

Designed to meet the demands of tomorrow’s high-speed 3G wireless and OC-768 networking technologies, Epiworks’ InP heterojunction bipolar transistors (HBT) combine high-frequency performance with ultra-low power consumption. Manufacturer of the world’s first 100 mm carbon-doped InP HBTs, EpiWorks continues to innovate by delivering advanced DHBTs and graded-base HBTs, in addition to our leading SHBTs.

### Specifications
- 50, 75, and 100 mm
- Carbon-doped InGaAs
- MOCVD production
- Digital and power applications

### Features and performance
- InP emitter
- Carbon doping for high reliability
- SHBT and DHBT
  - InGaAsP capability for advanced DHBT structures
  - Graded-base for higher gain and speed performance
- Quick-lot HBT fab and characterization available for maximum yield and quality

AlGaAs/GaAs Edge-Emitter Wafers

High-performance laser technology for industrial, medical, printer, and communications applications.

Designed to meet the demands of industrial, medical, printer, automotive, military, and communication applications, EpiWorks’ AlGaAs/GaAs edge-emitter epi wafers deliver the performance and reliability you demand. Manufactured on a state-of-the-art MOCVD production platform, EpiWorks wafers set a new standard for quality, performance, and yield.

L-I-V curve for an 808 nm AlGaAs/GaAs laser bar

A plot of the output power versus drive current and voltage from an 808 nm AlGaAs/GaAs edge-emitter laser bar. The laser bar has 46 emitters with a cavity length of 1 mm and a stripe size of 80 μm. The plot shows an excellent slope efficiency of 1.1 W/A with a threshold of 7.5 A.

Reliability for an 808 nm high-power laser

A lifetime plot for an 808 nm AlGaAs/GaAs edge-emitter laser bar with 46 emitters, a cavity length of 1 mm and an 80 μm stripe width. This device was tested under 28 A of drive current at 25°C and shows a lifetime greater than 1,200 hours.

PL map for a three-inch 808 nm high-power edge-emitting laser

A photoluminescence map (left) for a three-inch 808 nm laser. The map shows a standard deviation of less than 1 nm. The right graph shows a typical PL Avg. 791.2 nm Med. 791.2 nm Std. dev. 0.119% (0.945 nm) spectrum with a full-width at half-maximum of 15 nm.

Specifications
- 50, 75, 100 mm
- MOCVD production
- Laser applications

Features and performance
- Laser emission ranging from 740 nm to 980 nm
- QW Active Layer Materials: GaAs/AlGaAs/InGaAs/InAlGaAs/GaAsP/InGaAsP
- Carbon-doped GaAs up to 1E20
- Zinc-doped GaAs up to 1E20
- Carrier concentration verified via both Hall and Polaron
